

Water level in Lake Skorradalsvatn 2022

The water level of Lake Skorradalsvatn exceeded ON Power's limits in March of 2022 due to an intense snow melting event. In December, the water level dropped below ON Power's limits because of a long lasting cold period and minimal inflow to the lake. The Icelandic Meteorological Office has prepared an inflow model for Lake Skorradalsvatn, which shows the inflow into the lake three days in advance.
